NONKEY TELEPHONE SETS CONVERSION FOR USE WITH 1A1 OR 1A2 KEY TELEPHONE SYSTEMS

1. GENERAL

1.01 This section contains connections and conversion of nonkey general purpose sets to A lead control to permit their use with 1A1 or 1A2 key telephone systems.

All AC1 and AD1 telephone bases manufactured prior to 10-1-72 and any base which is opened for any reason should be rewired as shown in Table A before proceeding with connections shown in Tables B, C, and D.

1.02 This section is reissued to:

- Update connection information to show current 220- and 2220-type hand telephone sets with current AC- and AD-type telephone bases
- Show modular version connections to 554-, 702-, 2554-, 2660-, and 2702-type telephone sets

Since this reissue covers a general revision, arrows ordinarily used to indicate changes have been omitted.

- 1.03 Sets that are factory-wired for A lead control such as the 500L/M or 2500M are not included since no conversion is required.
- 1.04 The sets included in this section are equipped with line switches adjusted to break the line circuit before the A lead when going on-hook to

prevent false hold conditions. Field adjustment of line switch is not recommended. If these conditions can not be met, the set should be replaced.

2. CONNECTIONS

- 2.01 Connections shown provide for a separate ringer circuit when possible. This is necessary with older types of 1A1 KTS line circuits where tip and ring are not available for incoming signals at the telephone set.
- 2.02 At installations equipped with 1A1 or 1A2
 KTS line circuits where tip and ring are
 continuous to the telephone set and only one line
 is picked up, the R-R1 and B-B1 leads may not
 be required and the ringer can be connected across
 the line in the set. When used as an individual
 line ringer, the capacitor must be in the ringer
 circuit with the ringer poled as a ring station.
- 2.03 Some sets included in this section also have the capability of other services such as speakerphone, requiring additional connections and leads. For information on these features, refer to the Reference Section of the set involved.
- 2.04 For connection of the sets to separately mounted keys, refer to Division 512.
- 2.05 In sets having a dial light (TRIMLINE® or PRINCESS® type) A1 ground should not be common with one of the transformer leads. This is necessary to prevent feedback of ac to the A relay in the case of accidental grounding of the transformer leads.

NOTICE

Not for use or disclosure outside the Bell System except under written agreement

TABLE A

CONVERSION OF EARLY AC1 AND AD1 TELEPHONE BASES MANUFACTURED PRIOR TO 10-1-72 (SEE READ IN 1.01)
